

Critical KFI Header Correction

Existing KFI Behaviour Has Been Accidentally Altered

During development of the Sales Representative pricing functionality, the existing KFI header logic appears to have been changed.

This is not intended.

The new plugin should only extend the KFI product-line functionality to add Sales Representative pricing.

It must **not change the existing KFI customer-code or date-generation behaviour**.

Two regressions have been identified:

1. The KFI is using the customer's **Company Name** instead of the required **Customer Code**.
2. The KFI date has changed from **DDMMYY** to **DDMMYYYY**.

Both must be corrected.

1. Customer Code Must Come From the User Profile

The KFI `ORDEREV` record must use the value stored in the WordPress user's:

Customer Code

field.

The existing WordPress user meta key is:

bkk_customer_code

For example, the customer profile currently shows:

Customer Code: CAPASI

Therefore the KFI must contain:

CAPASI

It must NOT use:

Capital Asian ACT

or any other value from:

- Billing Company
- Shipping Company
- Company Name
- Billing First Name
- Billing Last Name
- Order company details

2. Incorrect Current Result

The generated KFI for order `11698` currently contains:

ORDEREV,Capital Asian ACT,...

This is incorrect.

`Capital Asian ACT` appears to be a company/billing value.

The KFI generator must not use this field for the ORDEREV customer identifier.

3. Correct Customer Code Source

For an authenticated WooCommerce customer order, obtain the user ID from the WooCommerce order.

Conceptually:

```
$user_id = $order->get_customer_id();
```

Then retrieve:

```
$customer_code = get_user_meta(  
    $user_id,  
    'bkk_customer_code',
```

```
        true
    );
```

The resulting `$customer_code` is what must be inserted into the `ORDEREV` KFI record.

Example:

```
WordPress User ID:
123

User Meta:
bkk_customer_code = CAPASI
```

KFI:

```
ORDEREV,CAPASI,...
```

4. Do Not Use Billing Company as a Fallback Without Approval

Do NOT use:

```
$order->get_billing_company()
```

as the Customer Code.

Do NOT use:

```
$order->get_shipping_company()
```

as the Customer Code.

Do NOT automatically substitute the company name if `bkk_customer_code` is empty.

These are different pieces of information.

If:

```
bkk_customer_code
```

is missing, the plugin should detect this as a data issue.

It should not silently replace it with the company name.

Recommended behaviour:

1. Check the order's WordPress user ID.
2. Retrieve `bkk_customer_code`.
3. Validate that it is not empty.
4. Use that exact value in the KFI.
5. If it is missing, log the problem for investigation.

Do not invent another customer identifier.

5. Required Example

For this customer:

First Name:

Andrew

Last Name:

Byrne

Company:

Capital Asian ACT

Customer Code:

CAPASI

The KFI must use:

CAPASI

The following is incorrect:

Capital Asian ACT

6. Date Format Must Remain DDMMYY

The original BKK KFI date format is:

DDMMYY

PHP date format:

```
dmy
```

Important:

```
d = two-digit day  
m = two-digit month  
y = two-digit year
```

Therefore:

```
26 August 2026
```

must become:

```
260826
```

It must NOT become:

```
26082026
```

7. PHP Date Format Difference

This distinction is important:

```
date( 'dmy' )
```

produces:

```
260826
```

while:

```
date( 'dmY' )
```

produces:

26082026

The KFI requires the first format:

dmy

with a lowercase **y**.

Do not use uppercase **Y**.

8. Recommended WooCommerce Date Handling

Use the WooCommerce order creation date.

Conceptually:

```
$date_created = $order->get_date_created();  
  
$order_date = $date_created  
    ? $date_created->date( 'dmy' )  
    : '';
```

For an order created on:

26 August 2026

the output must be:

260826

9. Correct ORDEREV Values for Order 11698

The current incorrect values are:

Customer identifier:
Capital Asian ACT

Date:
26082026

The required values are:

Customer Code:
CAPASI

Date:
260826

Therefore, when constructing the ORDEREV record:

{CUSTOMER_CODE}

must resolve to:

CAPASI

and:

{ORDER_DATE}

must resolve to:

260826

Do not otherwise change the existing comma/delimiter structure of the KFI header.

10. Preserve Existing ORDEREV Structure

The KFI header structure must remain based on the original BKK implementation.

Conceptually:

```
<KFI_version=1.0>  
<Object_id=107>  
<CloseOnSuccess>  
<Speed=70>  
<F7>ORDEREV,{CUSTOMER_CODE},...,{ORDER_ID},{DDMMYY},,,ONLINE<F4>
```

Only insert the correct dynamic values into their existing positions.

Do not redesign the ORDEREV format.

Do not:

- add new ORDEREV fields;
- remove existing commas;
- move the customer code;
- move the order ID;
- change the control tokens;
- change `ONLINE` ;
- change the date format.

11. Important Separation of KFI Changes

The new Sales Representative plugin requires a change to the **SYD product lines** so pricing can be added.

That change must remain separate from the existing ORDEREV header.

ORDEREV Header

Preserve existing behaviour:

```
Customer Code  
Order ID  
DDMMYY Date
```

SYD Product Lines

This is where the Sales Representative pricing enhancement belongs.

Example:

```
SYD, {SKU}, {QUANTITY}, , {PRICE}
```

The developer must not rewrite the ORDEREV data source while implementing the new SYD pricing field.

12. KFI Data Source Matrix

The developer must follow this mapping:

KFI Value	Required Source
Customer Code	WordPress user meta <code>bkk_customer_code</code>
Order ID	WooCommerce Order ID
Date	WooCommerce order creation date formatted <code>dmy</code>
Product SKU	WooCommerce order product SKU
Quantity	WooCommerce order line quantity
Sales Rep Price	Saved Sales Representative order-item unit price

Do not substitute unrelated WooCommerce billing fields.

13. Customer Code Validation

Before generating the KFI:

```

Get Order
  ↓
Get Customer/User ID
  ↓
Read bkk_customer_code
  ↓
Validate Customer Code
  ↓
Build ORDEREV

```

Recommended validation:

```

$customer_code = trim(
    (string) get_user_meta(
        $order->get_customer_id(),
        'bkk_customer_code',
        true
    )
);

```

If the customer code is:

CAPASI

use:

```
CAPASI
```

exactly as stored.

Do not translate it into the customer's company name.

14. Do Not Retrieve the Customer Code From Order Billing Data

The following logic would be incorrect:

```
$customer_code = $order->get_billing_company();
```

The following would also be incorrect:

```
$customer_code = $order->get_shipping_company();
```

or:

```
$customer_code = $order->get_billing_first_name();
```

The correct source is:

```
get_user_meta(  
    $user_id,  
    'bkk_customer_code',  
    true  
);
```

15. Regression Protection

These two original KFI behaviours are now considered **hard requirements**.

Future development must not change:

```
Customer Code Source:  
bkk_customer_code
```

or:

Date Format:
DDMMYY / dmy

without explicit BKK approval.

16. Required Testing

Test 1 — Customer With Customer Code

Profile:

Company:
Capital Asian ACT

Customer Code:
CAPASI

Expected KFI:

CAPASI

Not:

Capital Asian ACT

Test 2 — Date

Order Date:

26 August 2026

Expected:

260826

Incorrect:

26082026

Test 3 — Different Company and Customer Code

Example:

```
Company:
Example Asian Groceries Pty Ltd

Customer Code:
EXAMP1
```

Expected KFI:

```
EXAMP1
```

The company name must never replace the customer code.

Test 4 — Missing Customer Code

If:

```
bkk_customer_code = empty
```

the plugin must not silently use:

```
Billing Company
```

as a replacement.

Log the missing customer-code condition so it can be corrected.

17. Full KFI Regression Test

For every KFI generated after this correction, verify:

```
Customer Code:
Correct value from bkk_customer_code
```

Order ID:
Correct WooCommerce order ID

Date:
Exactly 6 digits in DDMMYY format

Product SKU:
Correct

Quantity:
Correct

Sales Representative Price:
Correct where applicable

Example date validation:

260826

Length:

6 characters

Not:

26082026

which is 8 characters.

18. Instruction to Claude AI

Before modifying the plugin again, locate the current KFI generation code and identify where:

1. Capital Asian ACT is being sourced.
2. The order date is being formatted.
3. The ORDEREV record is being constructed.
4. Sales Representative pricing is being added.

Restore the customer-code source to:

```
get_user_meta(  
    $order->get_customer_id(),  
    'bkk_customer_code',
```

```
    true  
);
```

Restore the date format to:

```
dmy
```

Do not use:

```
dmY
```

Do not use the billing company as the Customer Code.

Then implement the Sales Representative pricing enhancement without altering these existing ORDEREV rules.

19. Critical Acceptance Criteria

The KFI work is not complete unless all of these conditions pass:

- [] Customer Code comes from `bkk_customer_code`.
- [] Company Name is not used as the Customer Code.
- [] Order date is formatted `DDMMYY`.
- [] Date contains exactly six digits.
- [] 26 August 2026 outputs as `260826`.
- [] ORDEREV delimiter/control-token structure remains unchanged.
- [] WooCommerce Order ID remains correct.
- [] Existing product SKU remains correct.
- [] Existing quantity remains correct.
- [] Sales Representative price is added only to the intended SYD product line.
- [] No existing KFI header functionality is changed by the pricing enhancement.
